Department of Agriculture, Food and the Marine Protocol for TB Testing During the COVID 19 Pandemic

Issue date: 1st April 2020

During this challenging period associated with COVID-19 pandemic, the Department continues to seek to facilitate farmers in continuing efforts to eradicate TB and undertake testing as required, while also facilitating the continuation of animal movements and the continuity of all elements of the food supply chain. The overriding principle in all situations is that the health and safety of farmers, vets, service providers, contractors, other staff and their families is paramount.

These arrangements will continue in place until 2nd May 2020, subject to review. The COVID-19 situation is evolving, and in this context this guidance may change as a result. Updated guidance will be issued as necessary, based on HSE information (see https://www2.hse.ie/coronavirus/).

Key points:

- The Department is continuing to support farmers through this difficult time by prioritising the delivery of essential services for farmers. The Department supports TB testing continuity using safe practices which observe HSE guidelines, to protect trade and minimise TB spread at this time.

- **People are expected to follow the advice of the HSE at all times.** The Department will be guided by the HSE if further actions are required to be taken.

- As the situation evolves, management decisions will be made as regards the priority to be given to various activities.

- A protracted cessation of TB testing could result in prolonged higher levels of TB in cattle which could last for many years, such as was experienced in England and Wales after the suspension of testing during the 2001 Foot-and-Mouth Disease outbreak.

- Where a herd cannot be TB tested due to COVID19 related issues, the trading status of the herd will be suspended. However, **a grace period of 28 days from the date on which the herd test becomes overdue will be applied before this suspension comes into effect, during which the herd can continue trading.** When the suspension is then applied, moves directly to slaughter will still be permitted.

- Calves under **120 days of age** should not be TB tested, other than for reactor retests or for export.

- When working together TB testing cattle, maintain social distance.
Specific guidance for private veterinary practitioners (PVPs) and farmers related to COVID19 when TB testing cattle.

- People 70 years of age or over should now be cocooned in self isolation. Therefore no test should be undertaken with somebody aged over 70 present.
- Before commencing, the PVP should make a plan with the farmer regarding social distancing. This can include greater use of a head restraining gate or use of a longer guide stick to help to raise heads.
- Only essential personnel should be allowed to be present during a TB test. No children or non-essential adults should be present at any time during the test.
- Avoid direct close contact such as hand shaking.
- Use outdoor facilities where practicable
- When moving between farms – PVPs should fully and properly disinfect, including hand washing.
- Do not test an animal where the PVP or farmer form the opinion that social distancing guidelines cannot be complied with.

Specific guidance on situations which may arise:

If a situation arises which is not addressed in this document, please contact your RVO.

1. Calves under 120 days of age at the start of the TB test should not be tested, other than in reactor retests and for export purposes.

Due to the challenges of performing a TB test on very young calves while maintaining compliance with social distancing guidelines, calves aged under 120 days at the first day of the TB test are henceforward exempt from TB testing. All such calves will be eligible for movement once the herd retains its free status, until they reach 120 days of age. This exemption will apply until 2nd May 2020, at which point it will be reviewed.

This exemption does not apply to reactor retests, nor to the requirements for TB testing for export. Where a calf aged under 120 days is intended for export, the requirement for a 30 day pre-export TB test remains in place for calves >42 days of age. (Note: no pre-export TB test is required if the calf is under 42 days of age.)

2. A farmer is not available to present his/her cattle for TB testing as he/she is self-isolating due to symptoms of COVID19.

The farmer should follow HSE advice and not present the cattle for testing himself/herself. If possible, alternative arrangements should be made so that someone else can assist with the TB test on his/her behalf. If this is not possible, the RVO should be informed and the test can be delayed. The herd will have its trading status suspended due to being out of test. This suspension will be applied after a 28 day grace period, during which the herd can continue to trade. When the suspension is then applied, moves directly to slaughter will still be permitted.
3. A farmer is not available to present his/her cattle for TB testing as he/she is in a vulnerable or at-risk group and is self-isolating, or is over 70 years of age and is cocooning.

The farmer should not be required to present the cattle for testing himself/herself. If possible, alternative arrangements should be made so that someone else can assist with the TB test on his/her behalf. If this is not possible, the RVO should be informed and the test can be delayed. The herd will have its trading status suspended due to being out of test. This suspension will be applied after a 28 day grace period, during which the herd can continue to trade. When the suspension is then applied, moves directly to slaughter will still be permitted.

4. A PVP is scheduled to carry out a TB test but becomes unavailable due to COVID19 related issues (e.g. self isolation, cocooning or critical staff shortages within the practice).

The PVP should inform the farmer and the RVO at the earliest opportunity and try to arrange for an alternative PVP from the practice to carry out the test. If this is not possible, the RVO in consultation with the original PVP may contact a PVP from another practice to carry out the test. If these alternatives arrangements are not possible, the test can be delayed. The herd will have its trading status suspended due to being out of test. This suspension will be applied after a 28 day grace period, during which the herd can continue to trade. When the suspension is then applied, moves directly to slaughter will still be permitted.

5. If a TB test is delayed due to COVID19 related issues:

The delay in testing will not be a basis for referring the farmer for possible cross-compliance action. If the delayed test is a DAFM-paid test, a delay due to COVID19 will not be grounds to make it a farmer-paid test.

6. If it is not possible to test every animal while observing the appropriate social distance:

- The PVP should submit the test report with untested animals accompanied by note “unable to restrain”
- The RVO will suspend the herd and list a Miscellaneous Animal Test to the testing vet/practice.
- The vet can make arrangements to test the remaining cattle when adequate restraint to allow social distancing has been provided – this may involve use of a pen with a restraining head gate. Such arrangements may be made for calves under 120 days of age in reactor herds.
Follow best practice and HSE Guidelines on Hygiene

For your own protection and the protection of others, people involved in TB Testing must be familiar with the HSE guidelines especially:

- Wash your hands frequently – especially having been in contact with surfaces used by others
- Practice good respiratory hygiene, - when coughing and sneezing, cover your mouth and nose with flexed elbow or tissue – discard tissue immediately.
- Maintain social distancing, that is, leave at least a 2 metre distance between yourself and other people
- Do not shake hands
- Avoid crowded places especially indoors
- Reduce the number of people you meet.
- Avoid touching your eyes, nose and mouth.
- HSE have advised that for people working with the general public who are feeling well and do not have respiratory symptoms, facemasks are not recommended.
